SNPWG 16-19.1

Paper for Consideration by SNPWG

S-10n Product Specification Template and check list

Submitted by:	Jeppesen for IHO-TSMAD
Executive Summary:	TSMAD has drafted an S-10n Product Specification template and check list
	to improve the current template in S-100. TSMAD is soliciting comments on these drafts to ensure their usability for other IHO working groups.
Related Documents:	S-100 1.0.0, MPA product specification.
Related Projects:	S-100 2.0.0

Introduction / Background

The current template in S-100 is a bit primitive and considered by many difficult to use. To improve on this short coming of S-100, TSMAD is in the process of developing a new S-10n product specification template (Annex A) with more clear instructions in how to use the template. Furthermore, TSMAD has drafted a checklist (Annex B) to help those attempting to write a product specification to consider all necessary items for an S-100 based product specification.

Analysis/Discussion

The draft product specification template and draft checklist are, for the most part, derived from experience with developing S-101. SNPWG has gained some experience with product specifications while developing the MPA product specification and can therefore provide good feedback to the drafts. Furthermore, SNPWG focus on other domains than TSMAD, and are therefore in a good position to provide comments that will help TSMAD prepare these document in a way that simplifies the task of developing product specification for a wide set of domains.

Conclusions

The work with preparing better draft product specification template and checklist should be supported by SNPWG.

Recommendations

SNPWG should review the draft documents and provide feedback to SNPWG.

Justification and Impacts

SNPWG has experience that can help make the draft product specification template and checklist more versatile for the larger community.

Action Required of SNPWG

The SNPWG is invited to:

- a. Note this paper
- b. Review the draft product specification template and checklist
- c. Report any comments to TSMAD vice-chair

Data product specification metadata

<This information uniquely identifies this Product Specification and provides information about its creation and maintenance. For further information on dataset metadata see the metadata clause.>

7

Title: S-100 Version: 1.0.0 S-10n Version: 0.0.0 Date: Language: Classification: Contact: URL: Identifier: Maintenance: IHO Product Specification Maintenance

<This clause should be retained in IHO Product Specifications, for non IHO Product Specifications it may be removed or modified to meet the needs of the organization.> Introduction

Changes to S-10n will be released by the IHO as a new edition, revision, or clarification. **New Edition**

New Editions of S-10n introduce significant changes. *New Editions* enable new concepts, such as the ability to support new functions or applications, or the introduction of new constructs or anta types. *New Edition* are like to have a significant impact on either existing users of further users of 5-10.

Revisions are defined as substantive semantic changes to S-10n. Typically, revisions will change S-10n to correct factual errors; introduce necessary changes that have become evident as a result of practical experience or changing circumstances. A *revision* must not be classified as a clarification. *Revisions* could have an impact on either existing users or future users of S-10s. All cumulative *clarifications* must be included with the release of approved corrections revisions.

Changes in a revision are minor and ensure backward compatibility with the previous versions within the same Edition. Newer revisions, for example, introduce new features and attributes. Within the same Edition, a dataset of one version could always be processed with a later version of the feature and portrayal catalogues.

In most cases a new feature or portrayal catalogue will result in a revision of S-10n.

Clarification

Clarifications are non-substantive changes to S-10n. Typically, clarifications: remove ambiguity; correct grammatical and spelling errors; amend or update cross references; insert improved graphics in spelling, punctuation and grammar. A clarification must not cause any substantive semantic change to S-10n.

Changes in a clarification are minor and ensure backward compatibility with the previous versions within the same Edition. Within the same Edition, a dataset of one clarification version could always be processed with a later version of the feature and portrayal catalogues, and a portrayal catalogue can always rely on earlier versions of the feature catalogues.

Changes in a clarification are minor and ensure backward compatibility with the previous versions

Version Numbers

The associated version control numbering to identify changes (n) to S-10n must be as follows:

New Editions denoted as **n**.0.0 Revisions denoted as n.**n**.0 Clarifications denoted as n.n.**n**

Data Content and structure

Introduction

<This clause mandates different requirements for data product specifications. There are different requirements for feature based data and imagery based data. This template focuses only on feature based data>

Application Schema

<Normally, the full application schema is described in this section. It can be described using UML, however, for specifications that have large application schemas (such as S-101) it can also be realised in the feature catalogue and the product specification can contain specific examples.>

Feature Catalogue

Introduction

<The S-10n Feature Catalogue describes the feature types, information types, attributes, attribute values, associations and coles which may be used in an ENC.</p>
The S-10n Feature Cotalogue is available in an XML dequater value conformation be S/100 Keature Catalogue Schema and can be downloaded from the IFC website.
Feature Types

<The following clauses describe the different feature types that may be used in the feature catalogue.>

Geographic

<Geographic (geo) feature types form the principle content of the dataset and are fully defined by their associated attributes and information types.> Meta

<Meta features contain information about other features within a data set. Information defined by meta features override the default metadata values defined by the data set descriptive records.

Meta features must be used to their maximum extent to reduce meta attribution on individual features.>

Aggregated

<An Aggregated Feature Type is a feature which is made up of component features. > Feature Relationship

<A feature relationship links instances of one feature type with instances of the same or a different feature type. There are three common types of feature relationship: Association, Aggregation and Composition >

Information Types

<Information types are identifiable pieces of information in a dataset that can be shared between other features. They have attributes but have no relationship to any geometry; information types may reference other information types.> Attributes

<The following clauses specify the different types of attributes that may be used in a product specification. They may be either simple or complex.> Simple Attributes

< The following table is an example of the different types of simple attributes.>

Туре	Definition
Enumeration	A fixed list of valid identifiers of named literal values
Boolean	A value representing binary logic. The value can be either <i>True</i> or <i>False</i> . The default state for Boolean type attributes (i.e. where the attribute is not populated for the feature) is <i>False</i> .
Real	A signed Real (floating point) number consisting of a mantissa and an exponent
Integer	A signed integer pumber. The representation of an integer is encapsulation and usage
Charact Strip	An article region sequence of characters including access and becau or ractions from a repertone or one of the adopted character sets
Date	A date provides values for year, month and day according to the Gregorian Calendar. Character encoding of a date is a string which must follow the calendar date format (complete representation, basic format) for date specified by ISO 8601:1988.
	EXAMPLE 19980918 (YYYYMMDD)
Time	A time is given by an hour, minute and second. Character encoding of a time is a string that follows the local time (complete representation, basic format) format defined in ISO 8601:1988.
	EXAMPLE 183059 or 183059+0100 or 183059Z
Date and Time	A DateTime is a combination of a date and a time type. Character encoding of a DateTime shall follow ISO 8601:1988 EXAMPLE 19850412T101530

Dataset Types

Introduction

<There is the capability to have different types of datasets, typically they are classified as complete, scale dependent and scale independent. Most products that are designed to be used with an ENC will be of a complete nature – where it contains the information needed to form a complete picture.>

Dataset Loading and Unloading

< TSMAD to provide some guidance on how non ENC data should load and unload in relation to ENC data.>

Geometry

<Geometric representation is the digital description of the spatial component of an object as described in S-100 and ISO 19107. Specify which S-100 Level of Geometry is to be used in the product specification.>

Coordinate Reference Systems (CRS)

Introduction

<This clause specifies the type of Coordinate Reference System used in the product.> **Spatial reference system:**

EPSG Geodetic Parameter Registry

Coordinate reference system registry: Date type (according to ISO 19115):

International Organisation

of Oil and Gas Producers (OGP)

URL: http://www.ogp.org.uk/

Coordinate reference system identifier (CRSID):

Code space:

Data Quality

Responsible party:

< The data quality overview element should include at least the intended purpose and statement of quality or lineage. Other data quality elements cover: completeness, logical

11

consistency, positional accuracy, temporal accuracy, thematic accuracy, and anything specifically required for the product being specified.>

Data Capture and Classification

<The data product specification shall provide information on how the data is to be captured. This should be as detailed and specific as necessary.>

Maintenance

Maintenance and Update Frequency: Data Source: Production Process:

Portrayal

Item Name	Description	M/O	Card	type

	library			

Data Product format (encoding)

Introduction

<This clause specifies the encoding for S-10n datasets. While various encodings may be used such as GML and XML, if the primary intent is that this data will be used in conjunction with S-101 ENCs and on an ECDIS, then if possible the S-100 8211 encoding should be used.>

Data Product Delivery

Introduction

<This clause specifies the delivery mechanisms for datasets. > Units of Delivery: Transfer Size: Medium Name: Other Delivery Information: Dataset

Datasets

<Specify the types of datasets (New Edition, Update, Re-issue)>

12

Dataset size

<Specify the maximum dataset size> Dataset file naming

<Specify the dataset naming convention>

Support Files

<Specify if the product will utilize support files> Support File Naming

<Specify if naming convention for support files> Exchange Catalogue

<Specify if the datasets will be part of an exchange catalogue>

Metadata

Introduction

<This clause Specifies the discovery metadata for the dataset, it is usually in an XML format and conforms to S-100 metadata.> Language

<Specify the language to be used>

Annex A - Data Classification and Encoding Guide

S-10x Product Specification Check List

This check list is intended for developers of S-10x product specifications to ensure that they have completed all the necessary things that are needed to build an S-100 compliant product

	Description
	Determine who your user base is for this product as will determine what your
	primary data encoding will be. The following examples show the type of
	product versus the type of encoding:
	• 8211 – vector based products that are intended to be used on an
	ECDIS
	• XML – feature based products primarily for text heavy products
	such as sailing directions
	 GML – shore based GIS systems
	Define your real world features and attributes – if possible re-use existing
	features and attributes in the S-100 register.
	Determine your bindings for your features and attributes including:
	What are your mandatory attributes
	• Is the feature a surface, curve, or point
	Using the S-100 Data Coding and Classification Guide format is optional,
	however, it is a useful format in establishing how the features and attributes
	should be bound.
	Register any new features and attributes in the IHO S-100 register
	Determine if you need any new symbols for your features
\boldsymbol{f}	Create a draft S-1 S product statication using the IHO tenelate
	Crutour XVIL attendation using the HR four enabling shuild a
	Cr te ap X L prtr al Catalos Jusin me II D por al at og h ild
	Create Tote Data. Identity, one should work with a software rendor to create
	test products.
	Organize a test bed
